# metapath2vec: Scalable Representation Learning for Heterogeneous Networks

Yuxiao Dong (yuxdong@microsoft.com) University of Notre Dame & Microsoft Research

### Heterogeneous Network Embedding

- and edge types.
- of nodes.

### Heterogeneous Network Data

- AMiner [6]: 9-1.7 million authors, 3 million papers, 3800+ venues, & 8 categories of venues for labeling venues & authors.
- Computer Linguistics
- Computer Graphics
- Computer Networks
- **Computer Vision**
- Computing Systems
- Databases & Info
- Human Computer Interaction
- Theoretical Computer Science
- + #walks per node **w**: 1000 + walk length *I*: 100

meta-path: APVPA

- vector dimension *d*: 128
- neighborhood size k: 7
- #negative-samples: 5
- DBIS [5]: 5 thousand authors, 72 thousand papers, 464 venues.

Microsoft®

- The heterogeneous skip-gram model used in metapath2vec++ when predicting for  $a_4$ . Instead of one set of multinomial distributions for all types of neighborhood nodes in the output layer, it specifies one set of multinomial distributions for each type of nodes in  $a_{a}$ 's neighborhood.
- Network maximization in both

$$\arg \max_{\theta} \sum_{v \in V} \sum_{t \in T_V} \sum_{c_t \in N_t(v)} \log p(c_t | v; \theta)$$

Softmax in metapath2vec++

 $p(c_t|v;\theta) = \frac{v}{\Sigma}$ 

 $e^{X_{c_t} \cdot X_v}$ 

- Softmax in metapath2vec  $p(c_t | v; \theta) = \frac{e^{X_{c_t} \cdot X_v}}{\sum_{u \in V} e^{X_u \cdot X_v}}$
- Objective function in metapath2vec++ (heterogeneous negative sampling)

$$O(\mathbf{X}) = \log \sigma(X_{c_t} \cdot X_{v}) + \sum_{m=1}^{M} \mathbb{E}_{u_t^m \sim P_t(u_t)}[\log \sigma(-X_{u_t^m} \cdot X_{v})]$$
